Underwriting Document Workflow Automation

Process Automation Project for Underwriting Operations at Sequis Life

Operational Excellence Internship Project

Yusep Fathul Anwar

2026

Project Background

Business Problem

The Underwriting Operations team handled large volumes of PDF documents manually during daily processing activities.

The manual workflow created several operational challenges:

- Repetitive manual PDF merging process
- Inconsistent file naming and folder structure
- High risk of human error during document handling
- Time-consuming operational workflow
- Difficulties in managing large document volumes

Project Objective

To develop an automated underwriting document workflow system that standardizes, accelerates, and simplifies PDF processing operations.

Automation Workflow Solution

Program Process

Solution Overview

An automated workflow system was developed to simplify and standardize underwriting document processing operations.

Key Features

- Automated PDF merge
- Batch document processing
- Standardized file naming
- Automated folder organization
- Integrated Google Drive workflow

Technology Stack

- Python
- Google Colab
- Pymupdf
- Pandas
- OpenPyXL

Automation Preview

Operational Impact & Results

Workflow Process

Before Automation

Manual PDF merge

Repetitive file handling

High risk of human error

Time-consuming workflow

Manual folder organization

After Automation

Automated merge workflow

Streamlined processing

Standardized output

Faster processing

Automated folder classification

35–38x Faster Than Manual Processing

Key Improvements

- Reduced repetitive manual operations
- Improved processing efficiency
- Standardized document workflow
- Simplified high-volume PDF handling
- Improved operational consistency

Business Impact

The automation system helped streamline underwriting document operations by improving workflow efficiency, reducing manual processing activities, and supporting more standardized document handling.

Conclusion & Future Improvement

Conclusion

The underwriting document workflow automation system successfully improved operational efficiency within the Underwriting Operations team by reducing repetitive manual activities, accelerating PDF processing workflows, and standardizing document handling procedures. Through automation, the process became more consistent, scalable, and structured, helping minimize operational risks while supporting faster and more efficient underwriting document document processing activities.

Key Outcomes

- Faster and more consistent document processing
- Reduced operational workload
- Improved workflow standardization
- Better operational efficiency and scalability

Future Improvement

Automated document validation system

Integration with internal operational platforms

Real-time processing monitoring dashboard

OCR-based document recognition

Enhanced workflow tracking and reporting
